

## Assignment No 4

Date \_\_\_\_\_  
Page \_\_\_\_\_

Q1] Define the term stack overflow and underflow.

→ Stack Overflow:-

When we are trying to push element on the stack which is already full then stack overflow condition occurs.

Top = 3    40

2    30

1    20

0    10

Stack Size: 4.

Stack Underflow:-

When we try to pop the element on stack which is already empty, stack underflow condition occurs.

3

2

1

0

Top = -1

Stack Size: 4.

Q2] Explain concept of recursion with example.

- 
- Function calling itself is known as recursion.
  - It is defined as calling function on its own body.

\* Example:

```
#include <stdio.h>
```

```
#include <conio.h>
```

```
int fib(int num){
```

```

if (num == 0) {
    return 0; }
else if (num == 1) {
    return 1;
}
else { return (fib(n-1) + fib(n-2)); }
}

void main() {
    int n, i;
    printf("Enter number of terms: ");
    scanf("%d", &n);
    for (i = 0; i < n; i++) {
        printf("%d ", fib(i));
    }
    getch();
}

```

Q3] Write algorithm for performing push and pop operation on stack.

→ \* Algorithm for push operation on stack:

Step-I: Start.

Step-II: if (top == size-1), stack <sup>Full</sup> empty, else, goto step III.

Step-III: Increment top by one:  
i.e.: top += 1;

Step-IV: Push new element:  
data[top] = x;

Step-V: Stop.

\* Algorithm for POP operation on stack:

Step - I : Start

Step - II : if (top == -1), stack empty, else go to step - III.

Step - III : Decrement top by one:  
top -= 1;

Step - IV : Stop.

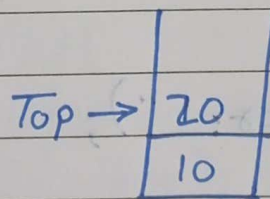

Q4] Define Stack and its operations.

→ \* Stack:

It is linear data structure in which elements are inserted and deleted from one end.

It is LIFO structure.

\* Eg:

Size : 3

\* Operations Performed On Stack:

i] Push: Used to insert data.

ii] POP: Used to delete data

20			
10	10		

Q5] WAP to calculate factorial using recursion.

→ #include <stdio.h>

#include <conio.h>

```
void int fact (int num){
```

```
if (n==0){
```

```
return 0;
```

```
}
```

```
if (n==1){
```

```
return 1;
```

```
}
```

```
else{
```

```
return n * fact (n-1);
```

```
}}
```

```
void main (){
```

```
int a;
```

```
printf ("Enter a number: ");
```

```
scanf ("%d", &a);
```

```
printf ("Factorial: %d", fact(a));
```

```
getch();
```

```
}
```

Q6] WAP to implement Push, POP, display operation on stack using array.

→ #include <stdio.h>

#include <conio.h>

```
int data [5]; top;
```

Date \_\_\_\_\_  
Page \_\_\_\_\_

```
void init(){
```

```
top = -1;
```

```
}
```

```
int  
void empty(){
```

```
if (top == -1){
```

```
return 1;
```

```
}
```

```
else {
```

```
return 0;
```

```
}}
```

```
int full(){
```

```
if (top == size - 1){
```

```
return 1;
```

```
}
```

```
else {
```

```
return 0;
```

```
}}
```

```
void Push(){
```

```
int x;
```

```
if (!full()){
```

```
printf("Enter element: ");
```

```
scanf("%d", &x);
```

```
top += 1;
```

```
data[top] = x;
```

```
}
```

```
else {
```

```
printf("Stack is full!");
```

```
}}
```

```
void Pop(){
```

```
int x;
```

```
if (!empty()){
```

```
x = data[top];
top--;
printf("%d Popped!", x);
}
else {
printf("Stack is empty!");
}
}

void display () {
int i;
for (i = top; i >= 0; i--) {
printf("%d", data[i]);
}
}

void main () {
int c;
init();
do {
printf("Enter choice: \n 1] Push \n 2] Pop \n 3] Display \n 4] Exit \n choice: ");
scanf("%d", &c);
switch (c) {
case 1:
push();
break;
case 2:
pop();
break;
case 3:
display();
break;
case 4:
exit(0);
break;
}
```

default:

```
printf("Invalid Choice!");  
} while (1);  
getch();  
}
```

Q7] Convert infix to postfix:  $((A+B)*D) \uparrow (E-F)$

→ I/P                      Stack                      O/P

$C$                        $\boxed{C}$                        $-$

$C$                        $\begin{array}{|c|} \hline C \\ \hline C \\ \hline \end{array}$                        $-$

$A$                        $\begin{array}{|c|} \hline C \\ \hline C \\ \hline \end{array}$                        $A$

$+$                        $\begin{array}{|c|} \hline + \\ \hline C \\ \hline C \\ \hline \end{array}$                        $A$

$B$                        $\begin{array}{|c|} \hline + \\ \hline C \\ \hline C \\ \hline \end{array}$                        $AB$

$)$                        $\boxed{C}$                        $AB+$

$*$                        $\begin{array}{|c|} \hline * \\ \hline C \\ \hline \end{array}$

$D$                        $\begin{array}{|c|} \hline * \\ \hline C \\ \hline \end{array}$                        $AB+D$

I/P	Stack	O/P
)		$AB + D *$
↑	↑	$AB + D *$
C	C ↑	$AB + D *$
E	C ↑	$AB + D * E$
-	- C ↑	$AB + D * E$
F	- C ↑	$AB + D * EF$
)	↑	$AB + D * EF -$

\* Post Fix Expression:  $AB + D * EF -$

Q8] Evaluate following postfix expression:

5, 6, 2, +, \*, 12, 4, /, -

→

I/P

Stack

Operation

5

5

6

6

5

2

2

6

5

+

8

5

$$A = 2, B = 6$$

$$B + A = 6 + 2 = 8$$

\*

40

$$A = 8, B = 5$$

$$B * A = 5 * 8 = 40$$

12

12

40

4

4

12

40

/

3

40

$$A = 4, B = 12$$

$$B / A = 12 / 4 = 3$$

-

37

$$A = 3, B = 40$$

$$B - A = 40 - 3 = 37$$

∴ Answer: 37.

Q9] Show effect of Push and POP on stack using diagram: (Size 10)

i] Push 10

ii] Push 20

iii] POP

iv] Push 30

→ ① Push 10

② Push 20

③ POP

④ Push 30
